## NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS

## RESEARCH MEMORANDUM

## MEASUREMENTS OF RUNWAY ROUGHNESS OF FOUR

## COMMERCIAL AIRPORTS

By Dexter M. Potter

## SUMMARY

Measurements of runway roughness were made on runways at Washington National Airport, New York International Airport, La Guardia Airport, and Logan International Airport, Boston, Mass. This report presents these measurements in the form of tables as well as plots.

## INTRODUCTION

There has been increased concern with runway roughness in connection with the taxi loads arising on new, large, high-speed airplanes as there are some indications that taxi loads are becoming the critical design loads for the main wing structure.

An initial step in the study of runway roughness was the measurement of roughness characteristics of two runways at Langley Air Force Base, Va. The data are presented in reference 1. As an additional aid in this study, it was thought desirable to obtain measurements of the roughness of runways of several commercial airports which have large amounts of traffic. These measurements have been obtained and are presented herein as elevation profiles in both plotted and tabular form. Because use has been made of previous runway-elevation measurements in analog computation of airplane taxi loads, and because interest has been expressed in similar use of the present measurements, the data are being presented in raw form prior to analysis of any kind in order to expedite distribution.

The roughness measurements were made in the same manner as that described in reference 1, that is, by means of a surveyor's level, rod, and tape, and by using an interval of 2 feet. The elevations were easily read to hundredths of a foot on the rod and were further estimated to thousandths of a foot.

## AIRPORTS AND RUNWAYS SURVEYED

The roughness measurements were made at the airports and on the runways indicated in the following list and are shown in figures 1 to 4:

| Airport   | Runway | Date (1955)                               |
|---|--------|---|
| Washington National . . . . .                     | 15     | Aug. 23 to 27                             |
| New York International . . . . .                  | 13R    | Oct. 1 to 5, 10                           |
| La Guardia . . . . . . .                          | 4      | Sept. 30                                  |
| Logan International,<br>Boston, Mass. . . . . . . | 22L    | Oct. 7, 11 to 12, 27<br>Oct. 18 to 21, 23 |

The dates of the surveys are included because it is well known that runway profiles change with time as a result of settling, resurfacing, new construction of cross runways, and other factors. As an example, a section of runway 22L at Logan International Airport between stations 1,770 and 2,444 was resurfaced after the first traverse of this runway was completed. This section was resurveyed and the later measurements are those given here.

The measurements were taken along a line parallel to and 10 feet to the left of the center line of the runway, approximately along the path of the left main gear of an airplane landing or taking off in the direction indicated by the runway designation. In addition, measurements 10 feet to the right of the center line were taken at La Guardia Airport.

The beginning of the pavement is taken as the zero station in all instances except for the measurements on the right side of the center line of runway 4 at La Guardia Airport where the pavement began opposite the 12-foot station on the left line of measurement. Therefore, for simplicity, the first station is arbitrarily called the 12-foot station.

The elevation references are arbitrary although the zero reference is close to sea level. Measurements have been obtained and are presented herein as elevation profiles in figures 5 to 8 and tables I to IV.
